Assignment Project Exam Help
UC Davis - 2020/2021

https://powcoder.com

Organization

Assignment

- Assignment released today
- Due in two weeks: Feb 12th
- Two parts
 - o Queue API
 - o User-level thread library

Assignment Project Exam Help

Teamwork

Two options: https://powcoder.com

- 1. Keep the same partner as P1
- 2. Change partner Add WeChat powcoder

Goal #1: queue API

- Most pieces of software need typical data structure implementations
 - Lists, stacks, queues, hashtables, dictionaries, etc.
- In many languages, directly included in language itself
 - Python (mylist = ["apple", "banana", "cherry"]), Javascript, Perl, etc.
- In some other languages, usually need to develop them from scratch
 - Especially true in Cand in system programming Exam Help
 - Linux: linux/inelude/
 - Glibc: glibc/include/list.h
 - GCC: gcc/gcc/lhttps://powcoder.com
 - Need very robust containers:
 - Add WeChat powcoder Clear API,
 - No memory leaks,
 - Stable.
 - Flexible,
 - Etc.

For this project, implement a queue library which API is provided

void *, a special kind of pointer

```
int queue_enqueue(queue_t queue, void *data);
int queue_dequeue(queue_t queue, void **data);
void myfunc(queue_t q)
                                                          content
   /* Various objects */
   short int a = 2;
   char *b = "P2 will teach me threads";
   struct {
                    Assignment Project Exam Help
       int stuff:
       char thing;
   \} c = \{ 10, 'c' \};
   int *d = malloc(10 * sizeof(int));
                            https://powcoder.com
   /* Push in queue */
   queue enqueue(q, &a);
   queue_enqueue(q, b);
                            Add WeChat powcoder
   queue_enqueue(q, &c);
   queue_enqueue(q, d);
   /* Retrieve from queue */
   short int *e:
   char *f;
   queue_dequeue(q, (void**)&e);
   queue dequeue(q, (void**)&f);
```

- void* is an **untyped** pointer
- Contains an address, but can't assume the type of the pointed

Double pointers

• A double pointer is simply the address of a pointer.

Execution

2 4

```
int a = 2;
                     int b = 4;
                     void change_ptr(int **ptr)
                         *ptr = \&b;
                     void change_val(int *ptr)
Assignment Project Exam Help
```

```
https://powcoder.com
```

int *c = &a;

Add WeChatingfowcoder

```
change_val(c);
printf("%d\n", *c);
change_ptr(&c);
printf("%d\n", *c);
return 0;
```

Variables vs pointers (1)

```
void swap(int x, int y)
                                 void swap(int *x, int *y)
   int tmp = x;
                                    int tmp = *x;
                                    *x = *v:
  x = y;
                                    *y = tmp;
   y = tmp;
}
int a = 2, b = 4; Assignment Project = Exam = Help
                                 printf("%d, %d\n", a, b);
printf("%d, %d\n", a, b);
                  https://powcoder.com
swap(a, b);
2, 4
                                 2, 4
2, 4
                                 4, 2
```

Variables vs pointers (2)

```
void swap(void **x, void **y)
void swap(void *x, void *y)
   void *tmp = x;
                                              void *tmp = *x;
                                              *x = *y;
   x = y;
                                              *y = tmp;
   y = tmp;
int a = 2, b = 4; Assignment Project = Exam=Help int *c = &a, *d = &b;
printf("%d, %d\n", *c, *dhttps://powcodef(con%d\n", *c, *d);
                                          swap(&c, &d);
swap(c, d);
printf("%d, %d\n", *c, *d, Add WeChat, powcoder, *c, *d);
2, 4
                                          2, 4
2, 4
                                          4, 2
```

Goal #2: uthread library

Write a thread library at user level.

- Kernel sees and schedules one process
- Inside the process, can schedule multiple threads of execution

ECS 150 - Project 2

Queue implementation

Demystify void *

Step 1

If struggling with void * for your implementation

- Copy queue. {c,h} elsewhere
- Temporarily replace all void * with int
- Implement a queue of integer with the suggested API

Assignment Project Exam Help

```
int queue_enqueue(queue_t queue, int data);
int queue_dequeue(queue_t queue, int *data);
int queue_delete(queue_t queue) int *data);
...
```

Step 2

- Once your implementation is solid
- Replace int by void *
 - o :%s/int/void */g
- Copy back into project 2

API vs implementation

Uthread library

- In directory libuthread
- API in headers
 - o private.h, queue.h, uthread.h
- Implementation of API in C file
 - context.c, preempt.c, queue.c, uthread.c
- Local Makefile generates a static library that contains the compiled code of libuthread. assignment Project Exam Help

 - At first, add only queue.o
 - Then, add the other bdjtps://powcoder.com

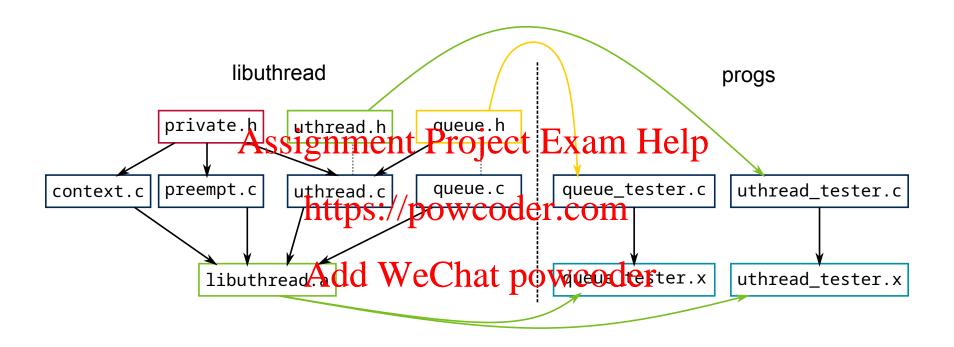

API vs implementation

Applications

- In directory apps
- Applications written by "external" users using the API
- Access to library through its public API
 - o #include <queue.h>
 - o #include <uthread.h>
- No access to the library's internals
 Otherwise implementation can hever evolve without breaking compatibility with existing applications
 - o Goal is that the applications shop to work or the my contementation
 - **NEVER** include C files in the applications
- Makefile combines the ligrary with the applications to be a second to the light and the light a
 - -L/path/to/libuthread -luthread

API vs implementation

Illustrated summary

Testing the queue

Test the API

Correctness

- Verify that the implementation actually respects the API
 - o E.g., enqueue item, then dequeue it and verify it's the same
- Build various scenarios, from very simple to complex

Error management

- Explore all the possible shistakes a user jourd de and theck the implementation behaves according to the specs
 - E.g., try to enqueue https://pew.codorrecomproper.error.code

Overall

Add WeChat powcoder Should come up with 10 to 20 different unit tests

- - Ideally get to 100% coverage
- Look at /home/cs150jp/public/p2/queue_tester_example.c to get an idea

Testing the queue

Debug

Printing

- 1. Add static helper function in queue.c (eg, queue_print()), call it from the other functions.
- 2. **Temporarily** add helper function in public API, call it from the applications. Remove entirely when done debugging.

GDB

Assignment Project Exam Help

• Breakpoints, step-by-step execution

```
• make D=1 https://powcoder.com
```

```
## Debug flag
ifneq ($(D),1)
CFLAGS += -02
else
CFLAGS += -g
endif
Add WeChat powcoder
```

join() mechanism

Simple example

```
int thread1(void)
   printf("thread1\n");
   return 5;
int main(void)
   int ret;
                     Assignment Project Exam Help Salue 5
   uthread_t tid;
   uthread start(0);
   tid = uthread_create(thread https://powcoder.wonthread1 died, unblocked main uthread ioin(tid, &ret);
   printf("thread1 returned %d\n", ret);
   uthread stop();
   return 0;
$ ./a.out
thread1
thread1 returned 5
$
```

- 1. main runs until join
 - Creates thread1 which is added to the ready queue
 - Gets blocked in join
- 2. thread1 runs entirely
 - Next available thread in ready queue
- 3. main() runs until the end
 - Retrieved return value
- Add WeChat poward eduled back to the ready queue
 - Resume previous execution

join() mechanism

Complex example

```
    main cannot be joined

uthread_t tid[2];

    For other threads, the

int thread2(void)
                                                                   parent/child relationship is not
   int ret;
   printf("thread2\n");
                                                                   relevant
   uthread_join(tid[0], &ret);
   printf("thread1 returned %d\n", ret);
   return 2;
                                                                 • The uthread library doesn't
                      Assignment Project Example to the return values,
int thread1(void)
   tid[1] = uthread_create(thread2)
                                                                   just provides the transmission
   printf("thread1\n");
                              https://powcoder.com<sup>mechanism</sup>
   return 1;
int main(void)
                              Add WeChat powcoder
   int ret:
   uthread_start(0);
   tid[0] = uthread create(thread1);
   uthread_yield();
   uthread_join(tid[1], &ret);
   printf("thread2 returned %d\n", ret);
   uthread stop():
   return 0;
```
